payback calculators

To help you quickly calculate payback on a property, Realworkspace has provided the following payback calculators. Explore various scenarios in real time by changing the data you enter. Click on a link below for the calculator you need.

At Realworkspace, your privacy and security are top priorities. Your individual information submitted here will never be distributed or sold. Please view our [privacy statement](#) for full details.

leasehold improvements payback calculator

Use the Leasehold Improvement Payback Calculator to calculate your payback and the break-even points of making capital improvements to a property.

- Leasehold Improvement Payback Calculator

refinance / break-even calculator

Calculate the savings and break-even point when refinancing with the Refinance / Break-even Calculator.

- Refinance / Breakeven Calculator

direct capitalization calculator

Use the Direct Capitalization Calculator to determine the value of a property based on its income and a given capitalization rate - or determine the capitalization rate based on its income and a given sales price.

- Direct Capitalization Calculator

valuation tool

Begin by indicating if you will be purchasing, selling or refinancing this property. Then select the level of detail you wish to receive based on the amount of information you have.

Before you begin, you will need the following information to value the property:

- zip code
- property type
- square footage
- expenses
- capital expenditures

If you currently have a mortgage on the property, please have the mortgage terms available.

value property

I want to:

15a05 modify an existing property valuation
15a10 value a new property

The level of detail I need is:

The screenshot shows the realWorksplace software interface. At the top, there's a toolbar with icons for back, forward, search, and other functions. Below the toolbar is a menu bar with File, Edit, View, Favorites, Address, Go, and Help.

The main header reads "realWorksplace" with sub-links for my realWorksplace, research, services, financing, leasing, and community.

A sidebar on the left has a "valuation tool" section with a "valuation tool" icon and a "valuation tool help" link.

The main content area is titled "step 2 for a property valuation". It contains a message: "In this step of the valuation process, enter operating income and expense data below. The A will provide you with market information. Click ▶ to go to a more detailed level, and click ▶ to go to a more summarized level. Remember, you can click on "save" to save your work at any time."

Below the message are five numbered steps: 1 property details, 2 operating data, 3 capital expenses, 4 mortgage, and 5 investment.

To the right of the steps is a "valuation outputs" section with a "valuation outputs" button.

At the bottom right of the main window is a "back save continue" button.

On the far right, there's a vertical sidebar with a "Default Annual Growth Rate: [0.00]" input field, a "Line Item" table, and a "Growth" table.

The "Line Item" table has columns for Line Item, %, \$ per SF/Unit, and Growth. It includes rows for Potential Gross Income, Less Vacancy and Credit Loss, Effective Gross Income, Operating Expenses, and Net Operating Income.

The "Growth" table has columns for Line Item, %, and \$ per SF/Unit. It includes rows for 5d05, 5d10, 5d15, 5d20, and 5d25.

17c05

17c10

17d05

17e00

Use the Mortgage calculator to enter mortgage data associated with the property. Below, each of the questions on this screen is discussed in detail.

Calculate loan amount, interest rate, payment amount or term. All the fields that appear on the screen are required. The fields that are being calculated for you are shown in red.

note: This calculator assumes monthly compounding. This calculator does not consider private mortgage insurance (PMI), insurance, homeowners costs or tax implications.

What type of mortgage are you considering?

You may choose either of two different types of mortgage rates, variable or fixed.

- **Fixed rate:** interest rate remains constant for the term of the loan
- **Variable rate:** interest rate changes over the term of the loan. The calculator assumes that the rate will be based on an index with scheduled rate changes, that is, after a specified number of periods at a specified number of periods between adjustments. While it is not possible to know what the interest will be after an adjustment, this calculator allows you to simulate scenarios based on your assumptions. For further information, refer to the Variable Rate Loan section below.

17e05

FIG. 17e

17e00

17e00

This calculator provides the option to consider three types of loan amortization:

- **Full Amortization:** loan payments will pay the loan balance in full at the end of the payment term.
- **Balloon:** loan balance will decrease based on the payment; however, the payment will **not** pay the loan balance in full at the end of the loan term. The payment you enter will consist of principal and interest. The calculator will determine the interest portion of the payment based on your input of payment term and the interest rate. A balloon term's payment is calculated as if the loan were to amortize over a longer time period than the length of the loan. The remaining principal is paid off when the balloon matures. For example, the payment is calculated to pay off in 30 years, but the loan is due in 5 years. In a Balloon loan with the balloon payment defined as **Percent of loan**, the payment is calculated based on the percentage of the loan balance that is due at maturity. In a Balloon loan with the balloon payment defined as **specified amount**, the payment is calculated based on the remaining loan balance that is due at maturity
- **Interest Only:** The loan balance will **not** decrease based on the loan payment. The payment pays off the interest due on the loan. At the end of the loan term, the full loan principle amount will be due.

17e10

17e15

FIG. 17e (cont.)

What is the first payment date?

17e00

What is the first payment date?

17e00

The information is used on the amortization schedule to provide you with payment dates. This field does not impact the calculations.

Do you want to calculate the interest rate inclusive of points and fees?

Calculate the impact of points and fees as they relate to the interest rate. You may include points as a percentage of the loan and/or as an explicit amount. Points can include origination, discount or buy down. Fees can include appraisal, application, title, or other fees. The interest rate, including points, calculates the final value by reducing the loan amount by the point value and/or other fees.

Mortgage Constant is the annual debt service divided by the loan amount. It is an indication of how much principal is being paid in the first year, and as such, is an indicator of how quickly the loan may be paid off. The higher the value of the mortgage constant, the more quickly the loan is being paid off.

Variable Rate Loans

This model assumes that the interest rate adjusts on regularly scheduled basis.

How many periods before the first adjustment?

17e30

Enter the number of periods from the loan date to the first adjustment date. You should refer to the payment frequency when answering this question. For example, if the payment frequency is quarterly and the rate

FIG. 17e (cont.)

17e00

How many periods between adjustments?

Enter the number of periods between adjustments . If the payment frequency is quarterly and the rate adjusts every 2 years, you would enter 8.

17e35

FIG. 17e (cont.)

17e00

What is the margin?

17e55

The margin is the amount that is added to the index to establish the interest rate on each adjustment date. Variable rate loans generally include a margin or some other percentage above the index value.

What do you predict will be the index change per adjustment?

17e60

Enter the percent change that you predict will occur in the index in for the rate. You may enter a negative or a positive change. The calculator will increase the interest rate by this amount for each of the adjustment dates until the rate reaches the maximum or minimum interest rate allowed on the loan.

Break Even is the point at which the cost of obtaining the new loan has been paid back by the decrease, if any, in the payments. In other words, the number of payments it takes to cover the points and fees you paid to refinance the mortgage.

Savings/(Cost) is the amount of cash you will pay(cost) or save(savings) based on a comparison between the total payments remaining on the current loan to the total payments on the new loan.

17e75

Present value tells you what the future payments are worth as cash today.

The screenshot shows a software window titled "mortgage calculator". The menu bar includes "File", "Edit", "View", "Favorites", "Address", "Go", and "Help". The toolbar contains icons for back, forward, search, and other functions. The main menu has "home", "my real workspace", "research", "services", "financing", "leasing", "community", and "calculator". The "calculator" menu is expanded, showing "calculation", "schedule", "graph", "summary", and "explanation". A sub-menu under "calculation" is open, listing "Mortgage", "Refinance", "Equity", "Mortgage Refinance", "Mortgage Equity", and "Mortgage Refinance Equity". The "Mortgage" option is selected. The "Mortgage" dialog box is visible, prompting the user to "Enter mortgage data associated with the property". It lists fields for "Loan amount", "Interest rate", "Term", "Down payment", "Property value", "Tax rate", "Insurance rate", and "Mortgage insurance (PMI) rate". The "Interest rate" field is highlighted in red.

Use the Mortgage calculator to enter mortgage data associated with the property. Below, each of the questions on this screen is discussed in detail.

Calculate loan amount, interest rate, payment amount or term. All the fields that appear on the screen are required. The fields that are being calculated for you are shown in red.

note: This calculator assumes monthly compounding. This calculator does not consider private mortgage insurance (PMI), insurance, homeowners costs or tax implications.

FIG. 19e

19e01

- Use the Mortgage calculator to enter mortgage data associated with the property. Below, each of the questions on this screen is discussed in detail.
- Calculate loan amount, interest rate, payment amount or term. All the fields that appear on the screen are required. The fields that are being calculated for you are shown in red.
- note: This calculator assumes monthly compounding. This calculator does not consider private mortgage insurance (PMI), insurance, homeowners costs or tax implications.

What type of mortgage are you considering?

You may choose either of two different types of mortgage rates, variable or fixed.

19e05

- **Fixed rate:** interest rate remains constant for the term of the loan
- **Variable rate:** interest rate changes over the term of the loan. The calculator assumes that the rate will be based on an index with scheduled rate changes, that is, after a specified number of periods and with a specified number of periods between adjustments. While it is not possible to know what the interest will be after an adjustment, this calculator allows you to simulate scenarios based on your assumptions. For further information, refer to the Variable Rate Loan section below.

19e00

The image shows a calculator screen with a menu bar at the top. Below the menu bar, there are two sections of text. The first section is titled "What type of amortization should we use?" and contains three bullet points describing different amortization methods: Full Amortization, Balloon, and Interest Only. The second section is titled "Do you want to calculate a payoff amount?" and contains a single bullet point about entering a payment value.

What type of amortization should we use?

- **Full Amortization:** loan payments will pay the loan balance in full at the end of the payment term.
- **Balloon:** loan balance will decrease based on the payment; however, the payment will **not** pay the loan balance in full at the end of the loan term. The payment you enter will consist of principal and interest. The calculator will determine the interest portion of the payment based on your input of payment term and the interest rate. A balloon term's payment is calculated as if the loan were to amortize over a longer time period than the length of the loan. The remaining principal is paid off when the balloon matures. For example, the payment is calculated to pay off in 30 years, but the loan is due in 5 years. In a Balloon loan with the balloon payment defined as **percent of loan**, the payment is calculated based on the percentage of the loan balance that is due at maturity. In a Balloon loan with the balloon payment defined as **specified amount**, the payment is calculated based on the remaining loan balance that is due at maturity.
- **Interest Only:** The loan balance will **not** decrease based on the loan payment. The payment pays only the interest due on the loan. At the end of the loan term, the full loan principle amount will be due.

Do you want to calculate a payoff amount?

FIG. 19e (cont)

What is the first payment date?

19e00

What is the first payment date?									
19e20									

The information is used on the amortization schedule to provide you with payment dates. This field does not impact the calculations.

Do you want to calculate the interest rate inclusive of points and fees?

Calculate the impact of points and fees as they relate to the interest rate. You may include points as a percentage of the loan and/or as an explicit amount. **Points** can include origination, discount or buy down. **Fees** can include appraisal, application, title, or other fees. The interest rate, including points, calculates the final value by reducing the loan amount by the point value and/or other fees.

Mortgage Constant is the annual debt service divided by the loan amount. It is an indication of how much principal is being paid in the first year, and as such, is an indicator of how quickly the loan may be paid off. The higher the value of the mortgage constant, the more quickly the loan is being paid off.

Variable Rate Loans

This model assumes that the interest rate adjusts on regularly scheduled basis.

How many periods before the first adjustment?

19e30

Enter the number of periods from the loan date to the first adjustment date. You should refer to the payment frequency when answering this question. For example, if the payment frequency is quarterly and the rate

19e00

How many periods between adjustments?

Enter the number of periods between adjustments.. If the payment frequency is quarterly and the rate adjusts every 2 years, you would enter 8.

Do you want to use the maximum rate adjustments? (worst-case scenario)

Because of the inability to predict interest rates, this calculator allows you to simulate the maximum rate change for each adjustment date without exceeding the maximum rate allowed for the loan. Deselecting the checkbox displays additional fields for entering assumptions about future interest rate changes.

What is the minimum rate?

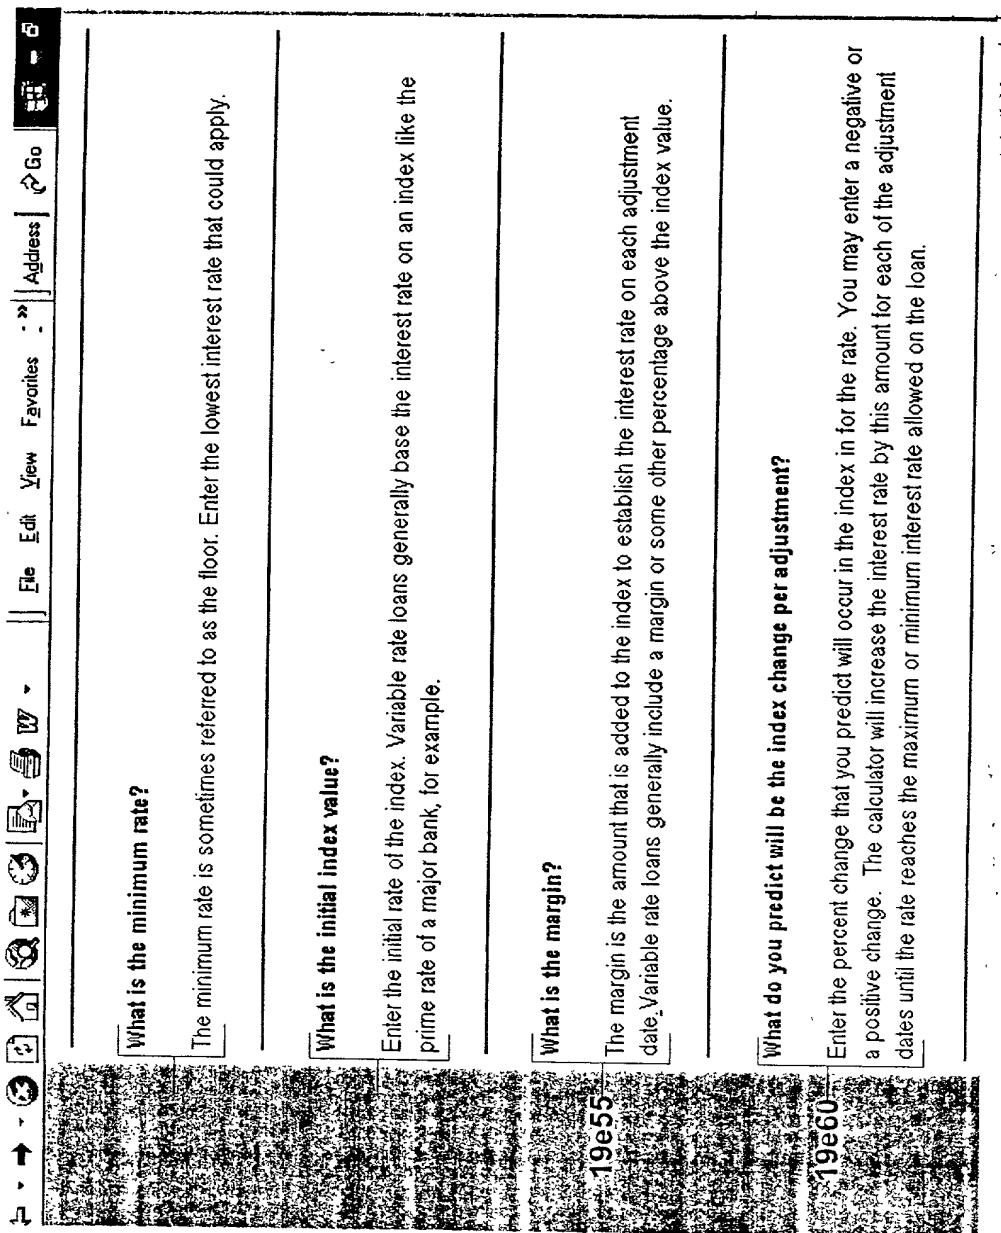

The minimum rate is sometimes referred to as the floor. Enter the lowest interest rate that could apply.

What is the initial index value?

Enter the initial rate of the index. Variable rate loans generally base the interest rate on an index like the prime rate of a major bank, for example.

FIG. 19e (cont.)

19e00

The calculator software interface shows a question about the minimum rate and its answer 19e00.

What is the minimum rate?

The minimum rate is sometimes referred to as the floor. Enter the lowest interest rate that could apply.

What is the initial index value?

Enter the initial rate of the index. Variable rate loans generally base the interest rate on an index like the prime rate of a major bank, for example.

What is the margin?

The margin is the amount that is added to the index to establish the interest rate on each adjustment date. Variable rate loans generally include a margin or some other percentage above the index value.

What do you predict will be the index change per adjustment?

Enter the percent change that you predict will occur in the index in for the rate. You may enter a negative or a positive change. The calculator will increase the interest rate by this amount for each of the adjustment dates until the rate reaches the maximum or minimum interest rate allowed on the loan.
